Substitution of stress of glycation of human complement factor H.";
Biochem. J. 274:473-480(191).
-!- FUNCTION: FACTOR B WHICH IS PART OF THE ALTERNATE PATHWAY OF THE COMPLEMENT SYSTEM IS CLEAVED BY FACTOR D INTO 2 FRAGMENTS: SA AND BB. ASERINE PROTEASE; THEN COMBINES WITH COMPLEMENT FACTOR 35 TO GENERALE THE G.3 OR C.S. CONVERTASE. IT HAS ALSO SEEN IMPLICATED IN PROLIFERATION AND DIFFERENTIATION OF PREACTIVATED B
                                                                                                                                                                                                                                                                                                                                                                   LYMPHOCYTES, RAPID SPREADING OF PERIDHERAL BLOOD MONOCYTES, STIMULATION OF LYMPHOCYTE BLASTOGENESIS AND LYSIS OF ERYTHROCYTES.
BA INHIBITS THE PROLIFERATION OF PREACTIVATED B LYMPHOCYTES.
CATALYTIC ACTIVITY: Cleaves C3 in the alpha-chain to yield C3a and C3b. Cleaves C5 in the alpha-chain to yield C3b and c3b. Cleaves C5 in the alpha-chain to yield C5b. Both cleaves Lake place at the C-terminal of an arginine residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wu L.C., Morley B.J., Campbell R.D.; "Cell-specific expression of the huma: complement protein factor B gene: evidence for the role of two distinct 5'-flanking elements.";

-!- FUNCTION: G-PROTEIN COUPLED RECEPTOR FOR OCTOPAMINE (OA), WHICH 1S
                                                                                    A NEUROTRANSHITTER, NEUROHORMONE, AND NEOROMODULATOR IN INVERTEBRATES. ACTIVATION OF THIS RECEPTOR BY OCTOPAMINE INDUCES OF ALL INDUCES AND INCREASE IN BOTH INOSITOL PHOSPHATES AND CYCLIC AMP. THE COUPLING TO ADENIZI CYCLES SEEMS TO BE LESS EFFICIENT THAN THE COUPLING TO PHOSPHOLIPASE C. THE RANK ORDER OF POTEMOY FOR AGONISTS IS P-SYNEPHRINE >= CLONDINE > P-OCTOPAMINE = PHYPROMINE >= PHENYLEPHRINE > NOREPINEPHRINE > B-HT920 > SEROIONIN = P-TYRAMINE > EPINEPHRINE > NOREPINEPHRINE > METHOXAMINE > DOPPAXINE = HISTHAINE | SEPINEPHRINE > HENTOLARIA | SEROIONIN > P-TYRAMINE > HORDOMAZINE | SPINEPHRINE > PHENTOLAMINE > P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                The present sequence represents a beta-amyloid peptide binding pratein (BBP). The polynuclocide comprising the entire BBP nucleotide sequence of clone BBP1-f1 is deposited under the accession number ATCC 96617. The polynucleotide comprising a fragment of BBP (nucleotides 202-807 of the full length BBP) of clone pEK196 is deposited as ATCC 98399. Host cells transformed with a vector comprising the BBP nucleic acid are used for the recombinant production of the protein. The protein can be used in a method for diagnosing a disease characterised by aberrant expression of human beta-amyloid protein (BAP). The protein can also be used in a method for screening for compounds which regulate expression of a 3AF binding protein. The proteins, antibodies and identified compounds can be used in the treatment or prevention of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            199..201

                                                                                                                                                                                                  The present sequence is the beta-amyloid peptide (BAP) binding protein-1 (BBP1). It is an integral membrane protein, that traverse the membrane twice. It is related to 6 protein-coupled receptor (GPCA) protein supertamily. It interacts with 6-alpha proteins and regulates the activity of G-protein signalling pathways. BBP genes are widely expressed in newronal cells of nonhuman primate (NHP) brain and overexpressed in some tumours. It functions as a suppressor of apoptosis induction. BBP proteins are used as immunogens to raise antibodies, useful as proteins are against so lidentify molecules which effect the interaction of BBP as reagents to identify molecules which effect the interaction of BBP and a cloned protein, that are useful in the treatment or prevention of diseases associated with apoptosis. The polynucleotides are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Noté: In claim 5, the patent claims an amino acid sequence from figure However, figure 2 does not contain any sequence. It is inferred from the disciosure that the figure 2 sequence refers to BBPI protein, shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; beta-amyloid peptide-binding protein; BAP; Abeta; betaAP; BBP; Alzheimer's disease; AD; transgenic; transgenic animal; gene therapy; neuroprotective; nootropic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human beta-amyloid peptide-binding protein, useful for diagnosing and/or treating diseases associated with aberrant expression of beta-amyloid peptide, e.g. Alzhelmer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Novel 3-protein-coupled receptor-like proteins and polynucleotides useful for regulating apoptosis, comprises integral membrane protein traversing the membrane twice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Walker SG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human secreted proteins, and encode the proteins given in ANT12261 to AANT22161 to and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, haematopoiesis regulating activity, receptor/ ligand activity, activity, haemosciatic and thrombolytic activity, receptor/ ligand activity, activity, activity activity, activity, the activity activity, activity activity, activity activity, activity activity activity, activity activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopolesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.
                                                                                                               The present invention relates to novel human beta-amyloid peptide (BAP). Abeta, betaAP)-binding (BBP) proteins and polynucleotides encoding such proteins. BBP sequences are useful to diagnose and/or treat diseases associated with aberrant expression of human BAP such as Aizheimer's disease (AD). They are used to generate transgenic animals. Sequences of the invention are also used in gene therapy. The present sequence is human BBP-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising nuclectide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nuclectides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby
can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; cytokine; cell proliferation; cell differentiation; growth factor haematopoiesis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastesis; cancer; tumour; haematopoietic disorder; myeloid cell disorder; lymphoid cell disorder; propietic disorder; chronic inflammatory condition; proliferative retinopath; chronic inflammatory condition; proliferative retinopath; bone disorder; osteoporosis; vascular growth disorder; cell culture; drug screening; infection; immune disorder; artissue regeneration; wound healing; infection; immune disorder; antisture; drug screening; gene therappy; antisifialammatory; antisthritic; haemostatic; antisateriosclerotic; cytostatic; osteopathic; vascupolic; cardiant; virucide; antibacteriai; antifungal; vulnerary; antiulcer.

The invention relates to a transfection agent comprises a peptide of about 16 - 30 amino acids in length. Peptides of the invention comprise a hydrophobic domain, a hydrophilic domain, a poptionally a spacer sequence between the domains and a functional group conjugated to at least one terminal of the peptide. Peptides of the invention are useful for a non-covalent association with and transport of a heterologous compound into a cell. They are also useful for promoting the cellular into a cell. They are also useful for promoting the cellular internalisation of at least one member e.g. peptide, proteins, articodies, their derivatives and/or conjugates. They may form part of a piarmaceutical composition to deliver the compound selected from a diagnostic or therapeutic compound, to treat at least one condition such as camer or an infectious disease, or which targets a cancerous cell and to deliver a peptide or inhibitor that its pathogen-infected cell and to deliver a peptide or inhibitor that its armost the activity of the enzyme. The agent of the invention has a transfection efficiency of at least 5% for at least two of the members of the group of the compounds and cell types, has a low toxicity, are a broad spectrum of compounds and cell types, has a low toxicity, are a broad spectrum of pompulate in conjunction with the many different compound types that it can deliver. The peptides are serum sensitive, thus they bode particularly well for systemic and/or localised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in patients. The current sequence represents a new amphipathic peptide vector of the invention that contains a cationic nuclear localisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  vertebrate; therapeutic; tissue imaging;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Delivering agent to target site in vertebrate comprises loading red
is useful for a non-covalent association with and transport of Reterologous compound into a cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       C×COOOCCCCCCCCCCCCCXXXAAAA
                    potential therapeutic applications. The polypeptides of the invence of inferential therapeutic applications. The polypeptides of the invence of inferentiation activities; including cytokine, cell proliferation or cell feature activity; activity tissue growth activity; hammatopolesis regulatory activity; tissue growth activity; chammatopolesis regulatory activity; tissue growth activity; immunomodulatory activities; tissue growth activities; chemoteric or chemokinetic activities; hammatory activities; and respect thrombolytic activities; concer cell proliferation or metastasis. Concepted in oncogenesis, cancer cell proliferation or metastasis. Concepted in oncogenesis, cancer cell proliferation or metastasis. Conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include cancers, hemmatopoletic disorders (e.g., myeloid or lymphoid cell disorders or proliferative retinopathy, atherosclerosis, coronary heart disease.

Cancers, chronic inflammatory conditions (e.g., astama or arthrisis), proliferative retinopathy, atherosclerosis, coronary heart disease.

Cancers, chronic inflammatory conditions (e.g., vistoporosis), and abmormat vascular growth. Polypeptides involved with tissue regeneration and vascular growth. Polypeptides involved with tissue regeneration and fungal infections in addition to immune disorders.

Companies them cells in culture to give rise to neuroepithelial cells may also be used in the diagnosis of the above conditions, and in drug companies and not promote of the condiming techniques. The present sequence represents a novel human convergence of the inventing conditions, and indices on promote of the inventing techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

blood cell with virus or virus-like particle comprising agent, sensitizing cell, introducing cell into vertebrate and applying energy to release virus particle from cell -

Disclosure; Page 55; 87pp; English.

The invention relates to delivering an agent to a target site in a vertebrate. The method involves (a) loading a red blood cell (RBC) with a virus or a virus-like particle (1) comprising an agent; (b) sensitizing RBC to render it more susceptible to disruption than unsensitized RBC; (c) introducing RBC into a vertebrate, and (d) applying energy to release (I). Steps (a) and (b) may be performed in any order. (II) (RBC loaded with a virus or a virus-like particle comprising a therapeutic agent to a larget site in a vertebrate, or in the preparation of a mediament of delivery of a therapeutic agent to a target site in a vertebrate and of also useful for delivering one or more agents to a vertebrate and for treating or preventing a disease. The method is useful for delivering agents such as those useful for imaging of tissues in vivo or ex vivo, preferably for delivering an agent to a subcellular organelle such as nucleus, mitochondria, G5.gi or endoplasmic reticulum. The present sequence represents a signal sequence based peptide: MPS peptide a chimera of the hydrophobic terminal domain of viral ap41 protein and the succiear localisation signal (NLS) from the SV40 large antigen. This fragment has been found to be active in membrane translocation.

The present invention relates to a method of quantifying the expression of target genes in living cells. The method involves providing cells that possess a target gene of interest which has been tagged with the binding site for an RNA binding protein and a fluorescently labelled RNA binding protein and a fluorescently labelled RNA binding polypeptide that includes an RNA binding domain and calculating the quantity of target gene expression in the cells using fluorescence signalling techniques. The method is useful for quantifying expression of one or more target genes in living cells which comprise two or more distinct populations of cells. It is used to quantifate the expression of any target gene, including expression of protein-encoding messenger. RNA genes, ribosomal RNA encoding genes and transfer RNA encoding qenes so long as the RNA expression product from the target gene possesses a sequence or structure (the RNA tag) that is bound specifically by the RNA binding polypeptide being used. The present sequence is a fluorescently labelled RNA binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Intracellular delivery; transfection agent; cancer; infectious disease;

Transfection agent that comprises a peptide comprising hydrophobic and hydrophilic domain and having amino acid residues of specified length is useful for a non-covalent association with and transport of a heterologous compound into a cell

Example 2; Page 61; 156pp; English

The invention relates to a transfection agent comprises a peptide of

                                                                                                                                                      diagnostic or therapetics compound, to treat at least one condition such as cancer or an infectious disease, or which targets a cancerous cell or pathogen-infected cell and to deliver a poptide or inhibitor that disrupts the activity of the enzyme. The agent of the invention has a transfection efficiency of at least 5% for at least two of the members of a broad spectrum of compounds. The agent has a good delivery efficiency for a broad spectrum of compounds and cell types, has a low toxicity, are easy to handle and easy to formulate in conjunction with the many sensitive, thus they bede particularly well for systemic and/or iocalised in patients. The current sequence represents a new amphiputhic peptide vector of the invention that contains a calionic nuclear localisation
           a hydrophobic domain, a hydrophilic domain, optionally a spacer sequence between the domains and a functional group conjugated to at least one terminal of the peptide. Peptides of the invention are useful for a non-covalent association with and transport of a heterologous compound into a cell. They are also useful for promoting the cellular artibodies, their derivatives and/or conjugates. They may form part of a harmaceutical composition to deliver the compound selected from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Proparing a red blood cell vehicle suitable for delivering an agent to a target site in a vertebrate due to loading the red blood cell with an agent-membrane translocation sequence -
- 30 amino acids in length. Peptides of the invention comprise

         The invention describes a method of preparing a red blood cell vehicle suitable for delivering an agent to a target site in a vertebrate comprising providing a red blood cell and loading the red blood cell with an agent-WTS (membrane translocation sequence) conjugate. The red blood cells produced may be used in the preparation of a medicament for delivery of an agent to or at a target site and of one or more agents to a vertebrate. The agent is actively released from the red blood cell vehicle by application of a stimulus to disrupt the red blood cell vehicle. This sequence represents signal sequence based peptide 1. a chimeric peptide of the hydrophobic terminal domain of the viral gp41 protein and the nuclear localisation signal from simiar virus 40 (SV40) large antiger, one of the membrane translocation peptides tested
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MTS; membrane translocation sequence; plasma membrane; red blood cell; immunisation; antigen; intracellular delivery; therapeutic: HIV-1; trans-activating protein; Tat; Antenapedda nomeodomain protein; Antp-HD; VP22 protein; HSV-VP22; signal-sequence-based peptide; Tranportan; NLS; Amphiphilic model peptide; SV40; Simian virus 40; qp41;

comprises loading a cell with an agent-membrane translocation sequence carbonings the agent to cross the plasma membrane of a cell. Also disclosed can abling the agent to cross the plasma membrane of a cell. Also disclosed is a pharmaceutical composition comprising a red blood cell for delivery correctly and a method of immunisation of an animal with an anticularly a red blood cell, for the intracellular delivery of a chiquenty a red blood cell, for the intracellular delivery of a therapeutic agent to a target site. The method is particularly useful for preparticularly a red blood cell, for the intracellular delivery of a therapeutic agent to cross the plasma membrane of a target cell, and for selectively releasing the agent by the cells at the target site to facilitate the uptake of the agent by the cells at the target site. The cellitate dMTS sequences are from HIV-1 trans-activating protein (fat), brosophila Antennapedia homeodomain protein (Antp-HD), Herpes Simplex-1 brosophila Antennapedia homeodomain protein (Antp-HD), Herpes Simplex-1 crimanopertan and Amphiphilic model peptide. The sequence presented is the Signal-sequence-based opptide I, which comprises the hydrophobic terminal chambin the Viral gp41 protein and the nuclear localisation sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Red blood cell; transgenic; cytostatic; immunosuppressive; SV40; MPS; antificumatic; antiartbritic; dermatological; antithyroid; noctropic; neuroprectective; carebropretective; carediant; artifarthythmic; litholytic; antiinflammatory; nephrotropic; antidabetic; antiasthmatic; vinerary;

:
                                                The invention relates to producing a red blood cell suitable for delivery of a polypeptide to a vertebrate, by providing a transperie animal carrying and expressing a transpers encoding the polypeptide, obtaining a red blood cell containing the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 10% or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```

```
The present sequence is the beta-amyloid peptide (bAF) binding protein. (BBP3). It is an integral membrane protein, that traverse the membrane by the confidence of GPF) protein subject (GPF) protein superfamily. It interacts with G-alpha proteins and regulates the activity of G-protein signalling pathways. BBP genes are widely expressed in neuronal cells of nonhuman primate (NFP) brain and overexpressed in some tumours. It functions as a suppressor of apoptosis induction. SBP proteins are used as immunogens to raise antibodies, useful as therapeutics and as autiques in solid phase assays. They are also useful as reagents to identify molecules which effect the interaction of SBP and a cloned protein, that are useful in the treatment or prevention of diseases associated with apoptosis. The polyncieotides are useful tor

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. US20020146760A1

GENERAL INFORMATION:
APPLICANT: Ozonberger, Bradley A

APPLICANT: Applicant Home Products Corporation
TITLE OF INVENTION: No. US20020146760A1el G-Protein-Coupled Receptor-Like Proteins an
TITLE OF INVENTION: Polynucleotides Encoded By Them, and Metrods of Using
TITLE OF INVENTION: Same
FILE REFRENCE: AHP58165-0CPCT
CURRENT APPLICANTION NUMBER: US/09/833,503A

CURRENT APPLICANTION NUMBER: US/09/104,104

PRIOR FILING DATE: 1998-10-13

NUMBER OF SEQ ID NOS: 6

Nucleotide sequence of the colicin B activity gene cba: consensus

T pertapeptide among Tona-dependent colicins and receptors.";
J. Bacteriol. 169:3350-3357(1987).

-:- FUNCTION: THIS COLICIN IS A CHANNEL-FORMING COLICIN. THIS CLASS OF

TRANSMEMBRANE TOXINS DEPOLARIZE THE CYTOPLASMIC MEMBRANE, LEADING

C:- FUNCTION: COLICINS ARE POLYPEPTIDE TOXINS PRODUCED BY AND ACTIVE

AGAINST, ESCHERICHIA COLI AND CLOSELY RELATED BACIERIA.

-:- MISCELLANBOUS: THIS COLICIN REQUIRES TONB FOR ITS UPTAKE.

-:- SIMLARITY: HIGH IN THE N-TERMINAL FIRST 300 AMINO ACID RESIDUES

-:- HITH COLICIN D.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                     -:- SUBCELLUIAR LOCATION: Attached to the membrane by a GPI-anchor.
-:- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN PROSTATE (BASAL, SECRETORY AND NEUROENDOCRINE EPITHELLUM CELLS). ALSO POUND IN BLADDER (TRANSITIONAL EPITHELLUM), PLACENTA (TROPHOBLASTS), STOWACH (NEUROENDOCRINE CELLS), COLON (NEUROENDOCRINE CELLS) AND KIDNEY (COLLECTING DUCTS). OVEREXPRESSED IN PROSTATE CANCERS AND EXPRESSION IS CORFLATED WITH TUMOR STAGE, GRADE AND ANDROGEN-INDREPRINENCE. HIGHLY EXPRESSED IN PROSTATE CANCER BONE METASTAGES.
